

Project Idea 1: BRACU Club Management System

Main Concept It will be a centralized, interactive platform designed to streamline extracurricular activities at BRAC University. It connects general students, club executives, and the Office of Co-curricular Activities (OCA), replacing scattered social media groups with a unified system for event planning, member recruitment, and resource management.

Features

- 1. Multi-Tier User Profiles** Users can create profiles with distinct roles (General Student, Club Executive, OCA Admin). Students can track their club memberships and event attendance, while executives can manage their club's roster and submit proposals.
- 2. Smart Recruitment Matcher** Instead of students blindly applying to clubs, they can input their skills (e.g., graphics design, debating) and interests. The system evaluates these traits and automatically suggests clubs that are currently recruiting for those specific skill sets.
- 3. Inter-Club Collaboration Board** If a club needs specific equipment (like a DSLR camera) or a partner for a mega-event, they can post a request on this community board. Other clubs can offer their resources or agree to co-host, fostering better inter-club relations.
- 4. Secure Budget and Approval Tracker (Escrow-style)** When a club requests funds for an event, the system locks the proposed budget in a pending state. Once the OCA reviews and approves the event breakdown, the system officially logs the funds as allocated, keeping financial tracking transparent.
- 5. Automated Event Scheduler & Clash Detector** Executives can input proposed event dates and venue requirements. The system automatically cross-references the campus calendar to prevent room double-booking and alerts clubs if a similar major event is happening at the same time.
- 6. Dynamic Task Delegation System** The system automatically tracks the workload of club executives based on assigned tasks for upcoming events. If an executive is overloaded with pending duties, the system flags them and suggests delegating tasks to other available members.
